Released 03-June-2026

Ignore approvals from committers in Workzone Cloud

Workzone for Bitbucket Cloud now supports ignoring approvals from users who have contributed commits to a pull request.

When enabled, committer approvals are excluded from Workzone’s approval quota calculation, helping teams ensure that pull requests receive independent review before merge.

This is especially useful for compliance-sensitive workflows where users should not be able to satisfy approval requirements for changes they contributed themselves.

Released 07-Mar-2024

Improvements for ISO/FDA compliance posture. Pull request approvals with a digital signature now have a signing intent/role selector for the reviewer to record their intention or role when approving a pull request. Approver name, their role or intent, and the pull request git commit hash are recorded safely in the pull request history.

- Create Workzone reviewer rules with *group* reviewers, requiring a digital signature
- Set the approval quota to 1 or higher to enforce 1 or more approval signatures per group.
- The signature-approval reviewer must choose a role/group when signing the pull request.
- In the pull request approval process approvals from reviewers with overlapping group memberships are only counted against a single group.
-

Released 12-01-2023

Workzone settings on repository, project or workspace level. Repo settings inheritance from workspace or project. Configure Workzone for the entire workspace, for a single project or a single repository.

- If Workzone is configured at workspace level, all repositories inherit the settings
- If Workzone is configured at workspace and project level, all repos under the project inherit project settings, all other repos inherit workspace settings
- If Workzone is configured at repository level, no other settings are inherited from project or workspace level
- Decouple projects from workspace to add project settings.
- Decouple repositories from project or workspace settings to add repo settings
- Reset project settings to workspace settings to inherit workspace settings for a projects
- Reset repo settings to project or workspace settings to inherit the respective settings.

Released 12-12-2022

Digital signatures are now available within Workzone for Bitbucket Cloud. The new digital signature functionality lets you **digitally sign** pull request approvals with a personal signature token.

- CFR Part 11 compliance with digitally signed Pull Request Approvals
- Signees must approve with their personal signature token.
- Require N digital signatures before a Pull Request can be merged
- Track signed-off Pull Requests

Released 22-11-09

A new payment gateway has been introduced to Workzone Cloud, requiring teams consisting of 5 or more users to subscribe at a very low cost of USD $0.50c per user.

To ensure maximum security and ease of setting up, we will be utilizing Stripe for this new payment gateway update. The new payment process is found in the Workzone tab in Workspace settings.

To activate a subscription, complete the following steps;

1. Navigate to your Workspace Settings
2. Scroll down the left menu to “Subscription Settings” under the “Workzone” title.

3. On this screen, you can view your current workspace user count along with the estimated cost. Click “BUTTON?” to open Stripe.

Released 2022-08-15

Workzone pull request reviewer configuration on repository level now queries a repository specific endpoint in Bitbucket which allows both repository and workspace admins.

Repo-only admins can now configure Workzone reviewers.
